Package 'EuPathDB'

May 21, 2019

Title Provides access to pathogen annotation resources available on EuPathDB databases **Version** 1.5.0

Author Keith Hughitt, Ashton Trey Belew

Maintainer Keith Hughitt <khughitt@umd.edu>

Description Brings together annotation resources from the various EuPathDB databases (PlasmoDB, ToxoDB, TriTrypDB, etc.) and makes them available in R using the AnnotationHub framework.

Depends R (>= 3.5),

Biobase,

GenomicRanges,

GenomeInfoDbData,

AnnotationHub

Imports AnnotationHubData, Biostrings, BiocGenerics, data.table, dplyr, foreach, GenomeInfoDb, glue, httr, jsonlite, magrittr, readr, rtracklayer, rvest, utils, xml2

Suggests AnnotationDbi, AnnotationForge, AnnotationHub, Biobase, BiocManager,

BiocStyle, BSgenome, BiocInstaller, curl, desc, devtools,

GenomicFeatures, GenomicRanges, GO.db, KEGGREST, knitr, OrganismDbi,

RCurl, reactome.db, RSQLite, S4Vectors, stringr, testthat, tidyr

biocViews AnnotationData, AnnotationHub, DataImport, EuPathDB

Description

The primary problem this function seeks to solve is derived from the fact that some species names in the eupathdb contain characters which are not allowed in orgdb/txdb/organismdbi instances. Thus this invokes a couple of regular expressions in an attempt to make sure these generated packages are actually installable.

Usage

```
clean_pkg(path, removal = "-like", replace = "", sqlite = TRUE)
```

Arguments

path	Location for the original Db/Dbi instance.
removal	String to remove from the instance.
replace	What to replace removal with, when necessary.
salite	Also modify the salite database?

Details

One thing I should consider is to add some of this logic to my eupath queries rather than perform these clunky modifications to the already-generated packages.

Value

A hopefully cleaner OrgDb/TxDb/OrganismDbi sqlite package.

Author(s)

atb

copy_s3_file	Copy the relevant file for each data type into a place which is easy for
	pickup by s3.

Description

Copy the relevant file for each data type into a place which is easy for pickup by s3.

Usage

```
copy_s3_file(src_dir, s3_file, type = "bsgenome")
```

Arguments

src_dir Source directory for the package top be copied.

s3_file Where is the final file to be located?

type Which type of package is this?

download_eupath_metadata

Returns metadata for all eupathdb organisms.

Description

Returns metadata for all eupathdb organisms.

Usage

```
download_eupath_metadata(overwrite = FALSE, webservice = "eupathdb",
  bioc_version = NULL, dir = "EuPathDB", version = NULL,
  write_csv = FALSE, verbose = FALSE)
```

EuPathDB 5

Arguments

overwrite Overwrite existing data?

webservice Optional alternative webservice for hard-to-find species.

bioc_version Manually set the bioconductor release if desired.

dir Where to put the json.

version Choose a specific eupathdb version?

write_csv Write a csv file in the format expected by AnnotationHubData?

verbose Print helper message about species matching?

Value

Dataframe with lots of rows for the various species in eupathdb.

Keith Hughitt

EuPathDB: Access EuPathDB annotations using AnnotationHub

Description

EuPathDB provides an R interface for retrieving annotation resources from the EuPathDB databases: AmoebaDB, CryptoDB, FungiDB, GiardiaDB, MicrosporidiaDB, PiroplasmaDB, PlasmoDB, ToxoDB, TrichDB, and TriTrypDB using the Bioconductor AnnotationHub framework.

Details

There are currently two types of Bioconductor resources which can be retrieved for 194 supported organisms from the various EuPathDB databases:

- · OrgDB resources
- GRanges resources

The OrgDB resources provides gene level information including chromosome, location, name, description, orthologs, and associated GO terms.

The GRanges resources provide transcript-level information such as known exons and their corresponding locations.

Each of these resources are generated using information obtained from the EuPathDB GFF files along with queries made through the various EuPathDB web APIs.

For examples of how EuPathDB can be used to query and interact with EuPathDB.org resources, take a look at the vignette: browseVignettes(package="EuPathDB")

Use availableEuPathDB() to get a vector of available organisms.

extract_eupath_orthologs

Given 2 species names from the eupathdb, make orthology tables betwixt them.

Description

The eupathdb provides such a tremendous wealth of information. For me though, it is difficult sometimes to boil it down into just the bits of comparison I want for 1 species or between 2 species. A singularly common question I am asked is: "What are the most similar genes between species x and y among these two arbitrary parasites?" There are lots of ways to poke at this question: run BLAST/fasta36, use biomart, query the ortholog tables from the eupathdb, etc. However, in all these cases, it is not trivial to ask the next question: What about: a:b and b:a? This function attempts to address that for the case of two eupath species from the same domain. (tritrypdb/fungidb/etc.) It does however assume that the sqlite package has been installed locally, if not it suggests you run the make_organismdbi function in order to do that.

Usage

```
extract_eupath_orthologs(db, master = "GID", query_species = NULL,
  id_column = "ORTHOLOGS_ORTHOLOG", org_column = "ORTHOLOGS_ORGANISM",
  url_column = "ORTHOLOGS_PRODUCT", count_column = "ORTHOLOGS_COUNT",
  print_speciesnames = FALSE, webservice = "eupathdb")
```

Arguments

db Species name (subset) from one eupath database.

master Primary keytype to use for indexing the various tables.

query_species A list of exact species names to search for. If uncertain about them, add print_speciesnames=TRUE

and be ready for a big blob of text. If left null, then it will pull all species.

id_column What column in the database provides the set of ortholog IDs?

org_column What column provides the species name?
url_column What column provides the orthomol group ID?

count_column Name of the column with the count of species represented.

print_speciesnames

Dump the species names for diagnostics?

webservice Which eupathdb project to query?

extract_gene_locations 7

Details

One other important caveat: this function assumes queries in the format 'table_column' where in this particular instance, the table is further assumed to be the ortholog table.

Value

A big table of orthoMCL families, the columns are:

- 1. GID: The gene ID
- 2. ORTHOLOG_ID: The gene ID of the associated ortholog.
- 3. ORTHOLOG_SPECIES: The species of the associated ortholog.
- 4. ORTHOLOG_URL: The OrthoMCL group ID's URL.
- 5. ORTHOLOG_COUNT: The number of all genes from all species represented in this group.
- 6. ORTHOLOG_GROUP: The family ID
- 7. QUERIES_IN_GROUP: How many of the query species are represented in this group?
- 8. GROUP_REPRESENTATION: ORTHOLOG_COUNT / the number of possible species.

Author(s)

atb

```
extract_gene_locations
```

Clean up the gene location field from eupathdb derived gene location data.

Description

The eupathdb encodes its location data for genes in a somewhat peculiar format: chromosome:start..end(strand), but I would prefer to have these snippets of information as separate columns so that I can do things like trivially perform rpkm().

Usage

```
extract_gene_locations(annot_df,
  location_column = "annot_gene_location_text")
```

Arguments

```
annot_df Data frame resulting from load_orgdb_annotations() location_column
```

Name of the column to extract the start/end/length/etc from.

Value

Somewhat nicer data frame.

get_eupath_entry

Author(s)

atb

get_all_metadata
Invoke download_eupath_metadata() using all the sub-projects of the

EuPathDB.

Description

Invoke download_eupath_metadata() using all the sub-projects of the EuPathDB.

Usage

```
get_all_metadata(webservice = "all")
```

Arguments

webservice Assume all services are desired.

get_eupath_entry
Search the of

Search the eupathdb metadata for a given species substring.

Description

When querying the eupathdb, it can be difficult to hit the desired species. This is confounded by the fact that there are very similar named species across different EupathDB projects. Thus function seeks to make it a bit easier to find the actual dataset desired. If the specific species is not found, look for a reasonable approximation. stop() if nothing is found.

Usage

```
get_eupath_entry(species = "Leishmania major", webservice = "eupathdb",
  column = "TaxonUnmodified")
```

Arguments

species String containing some reasonably unique text in the desired species name.

webservice The EuPathDB webservice to query.

column Which column to use for getting the species name?

Value

A single row from the eupathdb metadata.

Author(s)

atb

get_eupath_fields 9

get_eupath_fields	Extract auery-	able fields	from the EupathDb.
gct_capatil_ittias	Danaci query	ubic ficius	nom me bapambo.

Description

This parses the result of a query to Eupath's webservice: 'GenesByMolecularWeight' and uses it to get a list of fields which are acquireable elsewhere.

Usage

```
get_eupath_fields(webservice, excludes = NULL)
```

Arguments

webservice Eupathdb, tritrypdb, fungidb, etc...

excludes List of fields to ignore.

Value

List of parameters.

get_eupath_pkgnames	Generate standardized package names for the various eupathdb	
	species.	

Description

This is a surprisingly difficult problem. Many species names in the eupathdb have odd characters in the species suffix which defines the strain ID. Many of these peculiarities result in packages which are non-viable for installation. Thus this function attempts to filter them out and result in consistent, valid package names. They are not exactly the same in format as other orgdb/txdb/etc packages, as I include in them a field for the eupathdb version used; but otherwise they should be familiar to any user of the sqlite based organism packages.

Usage

```
get_eupath_pkgnames(entry, version = NULL, column = "TaxonUnmodified")
```

Arguments

entry	A metadatum	entry.
-------	-------------	--------

version Choose a specific version of the eupathdb, only really useful when downloading

files.

column Which column to query to get the species name?

10 get_kegg_orgn

Details

The default argument for this function shows the funniest one I have found so far thanks to the hash character in the strain definition.

Value

List of package names and some booleans to see if they have already been installed.

Author(s)

atb

get_kegg_orgn

Search KEGG identifiers for a given species name.

Description

KEGG identifiers do not always make sense. For example, how am I supposed to remember that Leishmania major is lmj? This takes in a human readable string and finds the KEGG identifiers that match it.

Usage

```
get_kegg_orgn(species = "Leishmania", short = TRUE)
```

Arguments

species Search string (Something like 'Homo sapiens').
short Only pull the orgid?

Value

Data frame of possible KEGG identifier codes, genome ID numbers, species, and phylogenetic classifications.

See Also

RCurl

Examples

```
## Not run:
    fun = get_kegg_orgn('Canis')
    ## > Tid orgid species phylogeny
## > 17 T01007 cfa Canis familiaris (dog) Eukaryotes; Animals; Vertebrates; Mammals
## End(Not run)
```

```
get_orthologs_all_genes
```

Query ortholog tables from the eupathdb one gene at a time.

Description

Querying the full ortholog table at eupathdb.org fails mysteriously. This is a horrible brute-force approach to get around this.

Usage

```
get_orthologs_all_genes(entry = NULL, dir = "EuPathDB",
   gene_ids = NULL, overwrite = TRUE, species_list = NULL)
```

Arguments

entry An entry from the eupathdb metadata to use for other parameters.

dir Directory to which to save intermediate data (currently unused).

gene_ids List of gene IDs to query.
overwrite Overwrite the savefile?

get_orthologs_one_gene

This peculiar and slow querying of orthologs is due to me crashing the eupathdb web servers.

Description

Therefore, I wrote this, which queries one gene at a time. I think it would be nice to change this to query multiple genes at a time.

Usage

```
get_orthologs_one_gene(entry = NULL, gene = "LmjF.01.0010",
    dir = "EuPathDB", species_list = NULL)
```

Arguments

entry Metadata entry. gene What gene to query?

dir Where to put the checkpoint file?

Value

table of orthologs for our one gene.

kegg_vector_to_df

Convert a potentially non-unique vector from kegg into a normalized data frame.

Description

This function seeks to reformat data from KEGGREST into something which is rather easier to use.

Usage

```
kegg_vector_to_df(vector, final_colname = "first", flatten = TRUE)
```

Arguments

vector Information from KEGGREST

final_colname Column name for the new information

flatten Flatten nested data?

Details

This could probably benefit from a tidyr-ish revisitation.

Value

A normalized data frame of gene IDs to whatever.

Author(s)

atb

load_eupath_annotations

Shortcut for loading annotation data from a eupathdb-based orgdb.

Description

Every time I go to load the annotation data from an orgdb for a parasite, it takes me an annoyingly long time to get the darn flags right. As a result I wrote this to shortcut that process. Ideally, one should only need to pass it a species name and get out a nice big table of annotation data.

Usage

```
load_eupath_annotations(species = "Leishmania major",
  webservice = "tritrypdb", version = NULL, wanted_fields = NULL)
```

load_kegg_annotations 13

Arguments

species String containing a unique portion of the desired species.

webservice Which eupath webservice is desired?

version Gather data from a specific eupathdb version?

Value

Big huge data frame of annotation data.

Description

This seeks to take the peculiar format from KEGGREST for pathway<->genes and make it easier to deal with.

Usage

```
load_kegg_annotations(species = "coli", abbreviation = NULL,
flatten = TRUE)
```

Arguments

species String to use to query KEGG abbreviation.

abbreviation If you already know the abbreviation, use it.

flatten Flatten nested tables?

Value

dataframe with rows of KEGG gene IDs and columns of NCBI gene IDs and KEGG paths.

Author(s)

atb

load_orgdb_annotations

Load organism annotation data from an orgdb sqlite package.

Description

Creates a dataframe gene and transcript information for a given set of gene ids using the AnnotationDbi interface.

Usage

```
load_orgdb_annotations(orgdb = NULL, gene_ids = NULL,
  include_go = FALSE, keytype = "gid", strand_column = "cdsstrand",
  start_column = "cdsstart", end_column = "cdsend",
  chromosome_column = "cdschrom", type_column = "gene_type",
  name_column = "cdsname", fields = NULL, sum_exon_widths = FALSE)
```

Arguments

orgdb OrganismDb instance.

gene_ids Search for a specific set of genes?

include_go Ask the Dbi for gene ontology information?

keytype mmm the key type used?

strand_column There are a few fields I want to gather by default: start, end, strand, chromosome,

type, and name; but these do not necessarily have consistent names, use this

column for the chromosome strand.

start_column Use this column for the gene start.
end_column Use this column for the gene end.

chromosome_column

Use this column to identify the chromosome.

type_column Use this column to identify the gene type.

Use this column to identify the gene name.

fields Columns included in the output.

sum_exon_widths

Perform a sum of the exons in the data set?

Details

Tested in test_45ann_organdb.R This defaults to a few fields which I have found most useful, but the brave or pathological can pass it 'all'.

Value

Table of geneids, chromosomes, descriptions, strands, types, and lengths.

load_orgdb_go

Author(s)

atb

See Also

AnnotationDbi GenomicFeatures BiocGenerics columns keytypes select exonsBy

Examples

```
## Not run:
  one_gene <- load_orgdb_annotations(org, c("LmJF.01.0010"))
## End(Not run)</pre>
```

load_orgdb_go

Retrieve GO terms associated with a set of genes.

Description

AnnotationDbi provides a reasonably complete set of GO mappings between gene ID and ontologies. This will extract that table for a given set of gene IDs.

Usage

```
load_orgdb_go(orgdb = NULL, gene_ids = NULL, keytype = "gid",
  columns = c("go", "goall", "goid"))
```

Arguments

orgdb OrganismDb instance.

keytype The mysterious keytype returns yet again to haunt my dreams.

columns The set of columns to request.

Details

Tested in test_45ann_organdb.R This is a nice way to extract GO data primarily because the Orgdb data sets are extremely fast and flexible, thus by changing the keytype argument, one may use a lot of different ID types and still score some useful ontology data.

Value

Data frame of gene IDs, go terms, and names.

Author(s)

I think Keith provided the initial implementation of this, but atb messed with it pretty extensively.

See Also

AnnotationDbi GO.db magrittr select tbl_df

Examples

```
## Not run:
   go_terms <- load_go_terms(org, c("a","b"))
## End(Not run)</pre>
```

make_eupath_bsgenome

Generate a BSgenome package from the eupathdb.

Description

Since we go to the trouble to try and generate nice orgdb/txdb/organismdbi packages, it seems to me that we ought to also be able to make a readable genome package. I should probably use some of the logic from this to make the organismdbi generator smarter.

Usage

```
make_eupath_bsgenome(entry, version = NULL, dir = "EuPathDB",
  copy_s3 = FALSE, reinstall = FALSE, ...)
```

Arguments

entry Single eupathdb metadata entry.

version Which version of the eupathdb to use for creating the BSGenome?

dir Working directory.

copy_s3 Copy the 2bit file into an s3 staging directory for copying to AnnotationHub?

reinstall Rewrite an existing package directory.

... Extra arguments for downloading metadata when not provided.

Value

List of package names generated (only 1).

Author(s)

atb

make_eupath_granges 17

Description

There is not too much else to say. This uses import.gff from rtracklayer. I should probably steal my code from hpgltools to make this work for any version of a gff file, but the eupathdb is good about keeping consistent on this front.

Usage

```
make_eupath_granges(entry = NULL, dir = "EuPathDB", version = NULL,
  copy_s3 = FALSE)
```

Arguments

entry Metadatum entry.

dir Place to put the resulting file(s).

version Optionally request a specific version of the gff file.

copy_s3 Copy the 2bit file into an s3 staging directory for copying to AnnotationHub?

make_eupath_organismdbi

Create an organismDbi instance for an eupathdb organism.

Description

The primary goal of an organismdbi instance is to provide a series of links between an orgdb, txdb, and other relevant annotation packages (reactome/go/etc). In its current iteration, this function brings together a couple columns from the orgdb, txdb, GO.db, and reactome.db.

Usage

```
make_eupath_organismdbi(entry = NULL, version = NULL,
  dir = "EuPathDB", reinstall = FALSE, kegg_abbreviation = NULL,
  exclude_join = "ENTREZID", copy_s3 = FALSE)
```

Arguments

entry A row from the eupathdb metadataframe.

version Which version of the eupathdb to use for creating this package?

dir Directory in which to build the packages.

reinstall Overwrite existing data files?

18 make_eupath_orgdb

kegg_abbreviation

For when we cannot automagically find the kegg species id.

exclude_join I had a harebrained ide

I had a harebrained idea to automatically set up the joins between columns of GO.db/reactome.db/orgdb/txdb objects. This variable is intended to exclude columns with common IDs that might multi-match spuriously – I think in the end I killed the idea though, perhaps this should be removed or resurrected.

copy_s3 Copy the 2bit file into an s3 staging directory for copying to AnnotationHub?

Value

The result of attempting to install the organismDbi package.

Author(s)

Keith Hughitt, modified by atb.

make_eupath_orgdb

Create an orgdb SQLite database from the tables in eupathdb.

Description

This function has passed through multiple iterations as the preferred method(s) for accessing data in the eupathdb has changed. It currently uses my empirically defined set of queries against the eupathdb webservices. As a result, I have made some admittedly bizarre choices when creating the queries. Check through eupath_webservices.r for some amusing examples of how I have gotten around the idiosyncrasies in the eupathdb.

Usage

```
make_eupath_orgdb(entry = NULL, dir = "EuPathDB", version = NULL,
  kegg_abbreviation = NULL, reinstall = FALSE, overwrite = FALSE,
  copy_s3 = FALSE, do_go = TRUE, do_orthologs = TRUE,
  do_interpro = TRUE, do_linkout = TRUE, do_pubmed = TRUE,
  do_pathway = TRUE, do_kegg = TRUE)
```

Arguments

entry If not provided, then species will get this, it contains all the information.

dir Where to put all the various temporary files.

version Which version of the eupathdb to use for creating this package?

kegg_abbreviation

If known, provide the kegg abbreviation.

reinstall Re-install an already existing orgdb? overwrite Overwrite a partial installation?

copy_s3 Copy the 2bit file into an s3 staging directory for copying to AnnotationHub?

make_eupath_txdb

do_go	Create the gene ontology table?
do_orthologs	Create the gene ortholog table?
do_interpro	Create the interpro table?
do_linkout	Create a table of linkout data?
do_pubmed	Create a table of pubmed entries?
do_pathway	Create the pathway table?
do_kegg	Attempt to create the kegg table?

Value

Currently only the name of the installed package. This should probably change.

Author(s)

Keith Hughitt with significant modifications by atb.

Description

This will hopefully create a txdb package and granges savefile for a single species in the eupathdb. This depends pretty much entirely on the successful download of a gff file from the eupathdb.

Usage

```
make_eupath_txdb(entry = NULL, dir = "EuPathDB", version = NULL,
  reinstall = FALSE, copy_s3 = FALSE)
```

Arguments

entry One row from the organism metadata.

dir Base directory for building the package.

version Which version of the eupathdb to use for creating this package?

reinstall Overwrite an existing installed package?

copy_s3 Copy the 2bit file into an s3 staging directory for copying to AnnotationHub?

Value

TxDb instance name.

Author(s)

Keith Hughitt with significant modifications by atb.

20 move_final_package

make_taxon_names

Iterate through the various ways of representing taxon names

Description

Spend some time making sure they are valid, too. Thus we want to get rid of weird characters like hash marks, pipes, etc.

Usage

```
make_taxon_names(entry, column = "TaxonUnmodified")
```

Arguments

entry An entry of the eupathdb metadata.

column Which column should be used to query the species name?

Value

A list of hopefully valid nomenclature names to be used elsewhere in this family.

Author(s)

atb

move_final_package

Move a package file to its final location for collation by Annotation-HubData.

Description

Move a package file to its final location for collation by AnnotationHubData.

Usage

```
move_final_package(pkgname, type = "orgdb", dir = "EuPathDB")
```

Arguments

pkgname Name of package to move to its final home.

type Which type of package is this?

dir base working directory.

orgdb_from_ah 21

		_	
org	dh:	from	ah

Get an orgdb from an AnnotationHub taxonID.

Description

Ideally, annotationhub will one day provide a one-stop shopping source for a tremendous wealth of curated annotation databases, sort of like a non-obnoxious biomart. But for the moment, this function is more fragile than I would like.

Usage

```
orgdb_from_ah(ahid = NULL, title = NULL, species = NULL,
  type = "OrgDb")
```

Arguments

ahid TaxonID from AnnotationHub

title Title for the annotation hub instance

species Species to download type Datatype to download

Value

An Orgdb instance

Author(s)

atb

See Also

AnnotationHub S4Vectors

Examples

```
## Not run:
  orgdbi <- mytaxIdToOrgDb(taxid)
## End(Not run)</pre>
```

22 post_eupath_go_table

```
post_eupath_annotations
```

Gather all available annotation data for a given eupathdb species.

Description

This function fills in the parameters to post_eupath_raw() so that one can download all the available data for a given parasite into one massive table. It should also provide some constraints to the data rather than leaving it all as characters. Caveat: I manually filled in the list 'field_list' to include the variable names and their text associations. This is likely to change in future releases of the tritrypdb. It is probably possible to automagically fill it in. In addition, I am using GenesByMolecularWeight to get the data, which is a bit weird.

Usage

```
post_eupath_annotations(entry = NULL, dir = "EuPathDB",
    overwrite = FALSE)
```

Arguments

entry The full annotation entry.

dir A directory into which to write the intermediate savefile.

overwrite If a partial table exists, overwrite it?

Value

A big honking table.

Description

Use the POST interface to get GO data from the EuPathDB.

Usage

```
post_eupath_go_table(entry = NULL, dir = "EuPathDB",
    overwrite = FALSE)
```

Arguments

entry The full annotation entry.

dir Location to write savefiles.

overwrite Overwrite intermediate savefiles in case of incomplete install?

Value

A big honking table.

```
post_eupath_interpro_table
```

Use the post interface to get interpro data.

Description

Use the post interface to get interpro data.

Usage

```
post_eupath_interpro_table(entry = NULL, dir = "EuPathDB",
    overwrite = FALSE)
```

Arguments

entry The full annotation entry.

dir Location to which to save intermediate savefile.

overwrite Overwrite the savefile when attempting a redo?

Value

A big honking table.

```
post_eupath_linkout_table
```

Use the post interface to get linkout data.

Description

Use the post interface to get linkout data.

Usage

```
post_eupath_linkout_table(entry = NULL, dir = "EuPathDB",
   overwrite = FALSE)
```

Arguments

entry The full annotation entry.

dir Location to which to save intermediate savefile.

overwrite Overwrite the savefile when attempting a redo?

Value

A big honking table.

```
post_eupath_ortholog_table
```

Use the post interface to get ortholog data.

Description

Unfortunately, this function more often then not leads to a crash of the eupathdb webservers. As a result, I wrote a GET version of this which iterates one gene at a time.

Usage

```
post_eupath_ortholog_table(entry = NULL, dir = "EuPathDB",
  table = "OrthologsLite", gene_ids = NULL, overwrite = FALSE)
```

Arguments

entry The full annotation entry.

dir Location to which to save an intermediate savefile.

table This defaults to the 'OrthologsLite' table, but that does not exist at all eupathdb

subprojects.

overwrite Overwrite incomplete savefiles?

Value

A big honking table.

```
post_eupath_pathway_table
```

Use the post interface to get pathway data.

Description

Use the post interface to get pathway data.

Usage

```
post_eupath_pathway_table(entry = NULL, dir = "EuPathDB",
   overwrite = FALSE)
```

Arguments

entry The full annotation entry.

dir Location to which to save intermediate savefile.

overwrite If trying again, overwrite the savefile?

Value

A big honking table.

```
post_eupath_pubmed_table
```

Use the post interface to get linkout data.

Description

Use the post interface to get linkout data.

Usage

```
post_eupath_pubmed_table(entry = NULL, dir = "EuPathDB",
   overwrite = FALSE)
```

Arguments

entry The full annotation entry.

dir Location to which to save intermediate savefile.

overwrite Overwrite the savefile when attempting a redo?

Value

A big honking table.

post_eupath_raw The new eupath system provides 3 output types for downloading data.

This uses the raw one.

Description

For the life of me, I could not figure out how to query the big text tables as the tabular format. Every query I sent came back telling me I gave it incorrect parameter despite the fact that I was copy/pasting the example given me by the eupathdb maintainers. So, I got mad and asked it for the raw format, and so this function was born.

26 post_eupath_table

Usage

```
post_eupath_raw(entry, question = "GeneQuestions.GenesByMolecularWeight",
  parameters = NULL, table_name = NULL, columns = NULL,
  minutes = 10)
```

Arguments

entry Annotation entry for a given species

question Which query to try? Molecular weight is the easiest, as it was their example.

parameters Query parameters when posting

table_name Used to make sure all columns are unique by prefixing them with the table name.

columns Columns for which to ask.

minutes How long to wait until giving up and throwing an error.

Value

A hopefully huge table of eupath data.

dataframe representation of the result. Note: As of 2017/07/13, POST requests are not yet supported on EuPathDB. Note: 2017/07/13 POST

queries can only use the new API

Description

Queries one of the EuPathDB APIs using a POST request and returns a dataframe representation of the result. Note: As of 2017/07/13, POST requests are not yet supported on EuPathDB. Note: 2017/07/13 POST queries can only use the new API

Usage

```
post_eupath_table(query_body, entry, table_name = NULL, minutes = 20)
```

Arguments

query_body String of additional query arguments

entry The single metadatum containing the base url of the provider, species, etc.

table_name The name of the table to extract, this is provided to make for prettier labeling.

minutes A timeout when querying the eupathdb.

Value

list containing response from API request.

start_eupathdb 27

Author(s)

Keith Hughitt

start_eupathdb

Get started with EuPathDB

Description

Get started with EuPathDB

Usage

```
start_eupathdb()
```

Value

Used for its side-effect of opening the package vignette. A vector of experiment identifiers.

Author(s)

Keith Hughitt

Examples

```
start_eupathdb()
```

%:::%

R CMD check is super annoying about :::.

Description

In a fit of pique, I did a google search to see if anyone else has been annoyed in the same was as I. I was in no way surprised to see that Yihui Xie was, and in his email to r-devel in 2013 he proposed a game of hide-and-seek; a game which I am repeating here.

Usage

```
pkg %:::% fun
```

Arguments

pkg on the left hand side fun on the right hand side

Details

This just implements ::: as an infix operator that will not trip check.
